## **AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

- 1. (Currently amended) A method of determining cluster attractors for a plurality of documents, each document comprising at least one term, each term comprising one or more words, the method comprising: calculating, in respect of each term, a probability distribution indicative of the frequency of occurrence of [[the]] one other term in the instance where a document comprises said term and said one other term, [[or]] and in the instance where a document comprises said term and more than one other term, the respective frequency of occurrence of each [[,]] other term, that co-occurs with said term in at least one of said documents; calculating, in respect of each term, the entropy of the respective probability distribution; selecting at least one of said probability distributions as a cluster attractor depending on the respective entropy value.
- 2. (Original) A method as claimed in Claim 1, wherein each probability distribution comprises, in respect of each co-occurring term, an indicator that is indicative of the total number of instances of the respective co-occurring term in all of the documents in which the respective co-occurring term co-occurs with the term in respect of which the probability distribution is calculated.
- 3. (Previously presented) A method as claimed in Claim 1, wherein each probability distribution comprises, in respect of each co-occurring term, an indicator comprising a conditional probability of the occurrence of the respective co-occurring term in a document given the appearance in said document of the term in respect of which the probability distribution is calculated.
- 4. (Previously presented) A method as claimed in Claim 2, wherein each indicator is normalized with respect to the total number of terms in the <u>document</u>, or each [[,]] document in which the term in respect of which the probability distribution is calculated appears.

- 5. (Original) A method as claimed in Claim 1, comprising assigning each term to one of a plurality of subsets of terms depending on the frequency of occurrence of the term; and selecting, as a cluster attractor, the respective probability distribution of one or more terms from each subset of terms.
- 6. (Original) A method as claimed in Claim 5, wherein each term is assigned to a subset depending on the number documents of the corpus in which the respective term appears.
- 7. (Previously presented) A method as claimed in Claim 5, wherein an entropy threshold is assigned to each subset, the method comprising selecting, as a cluster attractor, the respective probability distribution of one or more terms from each subset having an entropy that satisfies the respective entropy threshold.
- 8. (Original) A method as claimed in Claim 7, comprising selecting, as a cluster attractor, the respective probability distribution of one or more terms from each subset having an entropy that is less than or equal to the respective entropy threshold.
- 9. (Previously presented) A method as claimed in Claim 5, wherein each subset is associated with a frequency range and wherein the frequency ranges for respective subsets are disjoint.
- 10. (Previously presented) A method as claimed in Claim 5, wherein each subset is associated with a frequency range, the size of each successive frequency range being equal to a constant multiplied by the size of the preceding frequency range in order of increasing frequency.
- 11. (Previously presented) A method as claimed in Claim 7, wherein the respective entropy threshold increases for successive subsets in order of increasing frequency.

12. (Original) A method as claimed in Claim 11, wherein the respective entropy threshold for successive subsets increases linearly.

## 13. (Cancelled)

- 14. (Currently amended) An apparatus for determining cluster attractors for a plurality of documents, each document comprising at least one term, each term comprising one or more words, the apparatus comprising: means for calculating, in respect of each term, a probability distribution indicative of the frequency of occurrence of [[the]] one other term in the instance where a document comprises said term and said one other term, [[or]] and in the instance where a document comprises said term and more than one other term, the respective frequency of occurrence of each [[,]] other term, the entropy of the respective probability distribution; and means for selecting at least one of said probability distributions as a cluster attractor depending on the respective entropy value.
- 15. (Previously presented) A method of clustering a plurality of documents, each document comprising at least one term, each term comprising one or more words, the method comprising determining cluster attractors in accordance with the method of Claim 1; comparing each document with each cluster attractor; and assigning each document to one or more cluster attractors depending on the similarity between the document and the cluster attractors.
- 16. (Original) A method as claimed in Claim 15, comprising: calculating, in respect of each document, a probability distribution indicative of the frequency of occurrence of each term in the document; comparing the respective probability distribution of each document with each probability distribution selected as a cluster attractor; and assigning each document to at least one cluster depending on the similarity between the compared probability distributions.
- 17. (Previously presented) A method as claimed in Claim 16, comprising organizing the

documents within each cluster by: assigning a respective weight to each document, the value of the weight depending on the similarity between the probability distribution of the document and the probability distribution of the cluster attractor; comparing the respective probability distribution of each document in the cluster with the probability distribution of each other document in the cluster; assigning a respective weight to each pair of compared documents, the value of the weight depending on the similarity between the compared respective probability distributions of each document of the pair; calculating a minimum spanning tree for the cluster based on the respective calculated weights.

18. (Currently amended) A computer-implemented method of clustering a plurality of documents, each document comprising at least one term, each term comprising one or more words, the method including: causing a computer to calculate, in respect of each term, a probability distribution indicative of the frequency of occurrence of [[the]] one other term in the instance where a document comprises said term and said one other term, [[or]] and in the instance where a document comprises said term and more than one other term, the respective frequency of occurrence of each [[,]] other term, that co-occurs with said term in at least one of said documents; causing the computer to calculate, in respect of each term, the entropy of the respective probability distribution; causing the computer to select at least one of said probability distributions as a cluster attractor depending on the respective entropy value.
